

What happens at every gate

Automatic. Announced every time with a "Consulting Codex" line. No command to remember, and no way to forget it.

What Codex never does

- ✗ write to your repository — it has no write path, only a read-only sandbox
- ✗ speak to you unfiltered — the raw reply is discarded after verification
- ✗ decide anything — agreement between two models is weak evidence, and Propel says so
- ✗ get invented — if the CLI didn't run, there is no Codex line in the card

Don't want it?

[/disable-codex](#)

Gates, questioners and auditors all still fire.
Only the second opinion goes away.

Two models disagreeing is the useful signal. Two models agreeing is cheap — they share most of their training data, so Propel reports consensus as weak evidence rather than as confirmation.
