

You describe the problem. Propel picks the mode.

No menu, no interruption. The choice is announced in one line with its reason, and it switches again on its own when the work crosses into another mode. /switch overrides it whenever you disagree.

YOUR FIRST MESSAGE

"how does the reward actually get computed here?"

What the mode never changes

Every mode stops at its gates and hands the decision back to you. A narrower mode runs fewer gates — it does not lower the bar at the ones it runs, and it never decides in your place to save you a question.
